

# SUBSPACE INFERENCE FOR BAYESIAN DEEP LEARNING

---

PAVEL IZMAILOV, WESLEY MADDOX, POLINA KIRICHENKO,  
TIMUR GARIPOV, DMITRY VETROV, ANDREW GORDON WILSON

## WHY BAYESIAN INFERENCE?

- ▶ Combining models for better predictions 
- ▶ Uncertainty representation (crucial for decision making) 
- ▶ Interpretably incorporate prior knowledge and domain expertise 

## WHY BAYESIAN INFERENCE?

- ▶ Combining models for better predictions 
- ▶ Uncertainty representation (crucial for decision making) 
- ▶ Interpretably incorporate prior knowledge and domain expertise 

## WHY NOT?

- ▶ Challenging for Deep NNs due to high dimensional weight spaces 

# SUBSPACE INFERENCE

A modular approach:

- ▶ Design subspace
- ▶ Approximate posterior over parameters in the subspace
- ▶ Sample from approximate posterior for Bayesian model averaging

# SUBSPACE INFERENCE

A modular approach:

- ▶ Design subspace
- ▶ Approximate posterior over parameters in the subspace
- ▶ Sample from approximate posterior for Bayesian model averaging

**We can approximate posterior of 36 million dimensional WideResNet in 5D subspace and get state-of-the-art results!**

# SUBSPACE

- ▶ Choose shift  $\hat{w}$  and basis vectors  $\{d_1, \dots, d_K\}$
- ▶ Define subspace  $S = \{w \mid w = \hat{w} + \underbrace{t_1 d_1 + \dots + t_k d_K}_{Pt}\}$
- ▶ Likelihood  $p(D \mid t) = p_M(D \mid w = \hat{w} + Pt)$ .

# INFERENCE

- ▶ Approximate inference over parameters  $t$ 
  - ▶ MCMC, Variational Inference, Normalizing Flows, ...
- ▶ Bayesian model averaging at test time:

$$p(D^* | D) = \frac{1}{J} \sum_{i=1}^J p_M(D^* | \tilde{w} = \hat{w} + P\tilde{t}_i), \quad \tilde{t}_i \sim q(t | D)$$

## TEMPERING POSTERIOR

- ▶ In the subspace model  $\# \text{ parameters} \ll \# \text{ data points}$ 
  - ▶  $\sim 5\text{-}10$  parameters,  $\sim 50\text{K}$  data points
- ▶ Posterior over  $t$  is extremely concentrated
- ▶ To address this issue, we utilize the tempered posterior:

$$p_T(t | D) \propto \underbrace{p(D | t)^{1/T}}_{\text{likelihood}} \underbrace{p(t)}_{\text{prior}}$$

- ▶  $T$  can be learned by cross-validation
- ▶ Heuristic:  $T = \frac{\# \text{ data points}}{\# \text{ parameters}}$

## SUBSPACE CHOICE

We want a subspace that

- ▶ Contains **diverse** models
- ▶ **Cheap** to construct

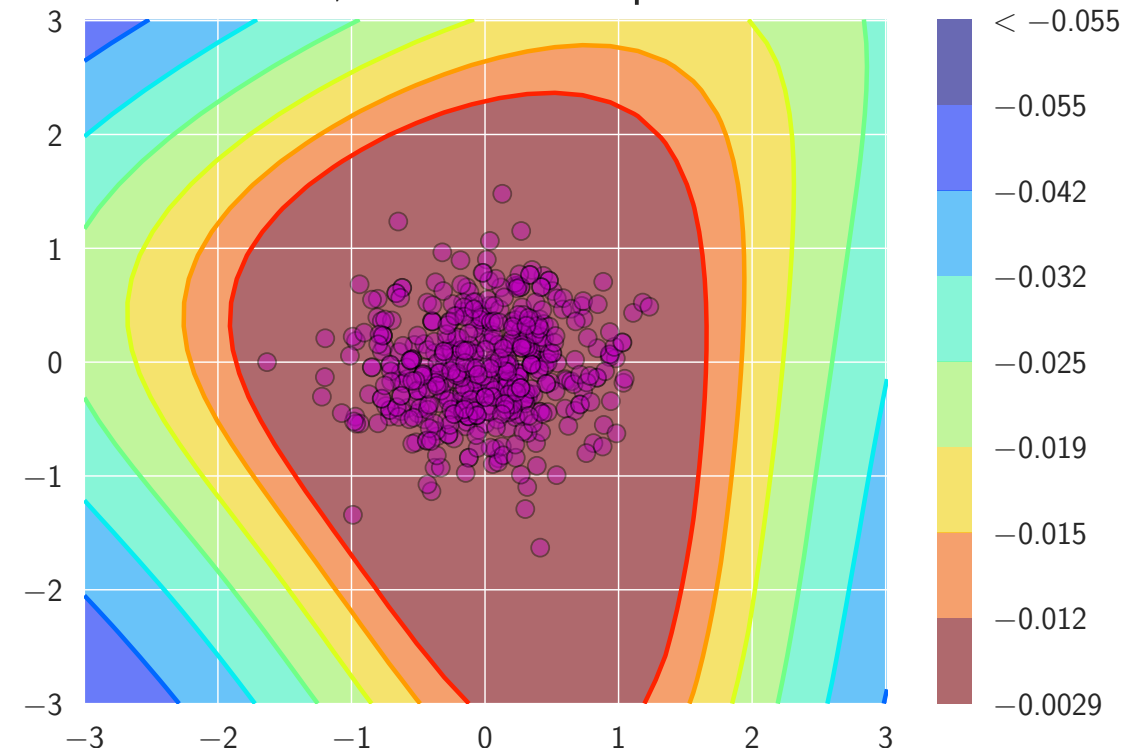

## RANDOM SUBSPACE

- ▶ Directions  $d_1, \dots, d_K \sim N(0, I_p)$
- ▶ Use pre-trained solution as shift  $\hat{w}$
- ▶ Subspace  $S = \{w \mid w = \hat{w} + Pt\}$

Predictive Distribution  
ESS, Random Subspace

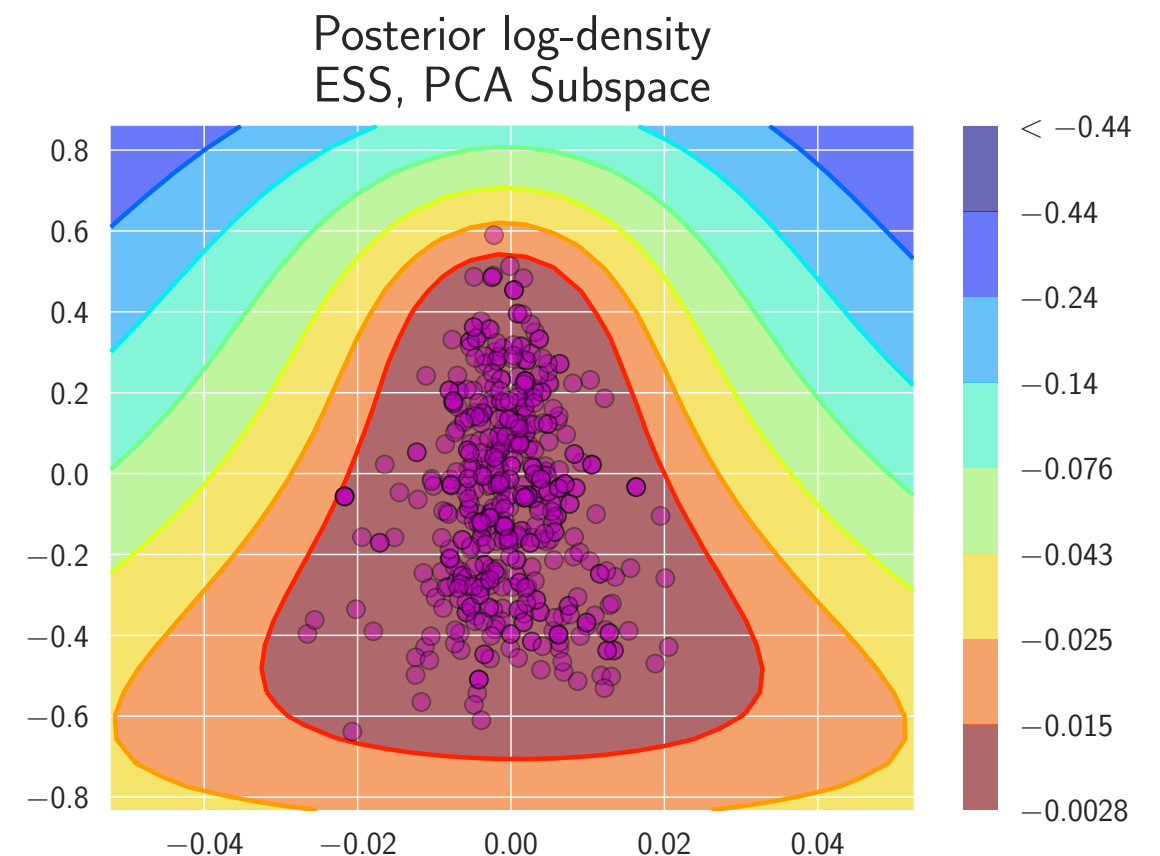

Posterior log-density  
ESS, Random Subspace

## PCA OF THE SGD TRAJECTORY

- ▶ Run SGD with high constant learning rate from a pre-trained solution
- ▶ Collect snapshots of weights  $w_i$
- ▶ Use SWA solution as shift  $\hat{w} = \frac{1}{T} \sum_i w_i$
- ▶  $\{d_1, \dots, d_K\}$  – first  $K$  PCA components of vectors  $\hat{w} - w_i$

## CURVE SUBSPACE

- ▶ Garipov et al. 2018 proposed a method to find 2D subspaces containing a path of low loss between weights of two independently trained neural networks

Predictive Distribution  
ESS, Curve Subspace

Posterior log-density  
ESS, Curve Subspace

# SUBSPACE COMPARISON

Predictive Distribution  
ESS, Random Subspace

Predictive Distribution  
ESS, PCA Subspace

Predictive Distribution  
ESS, Curve Subspace

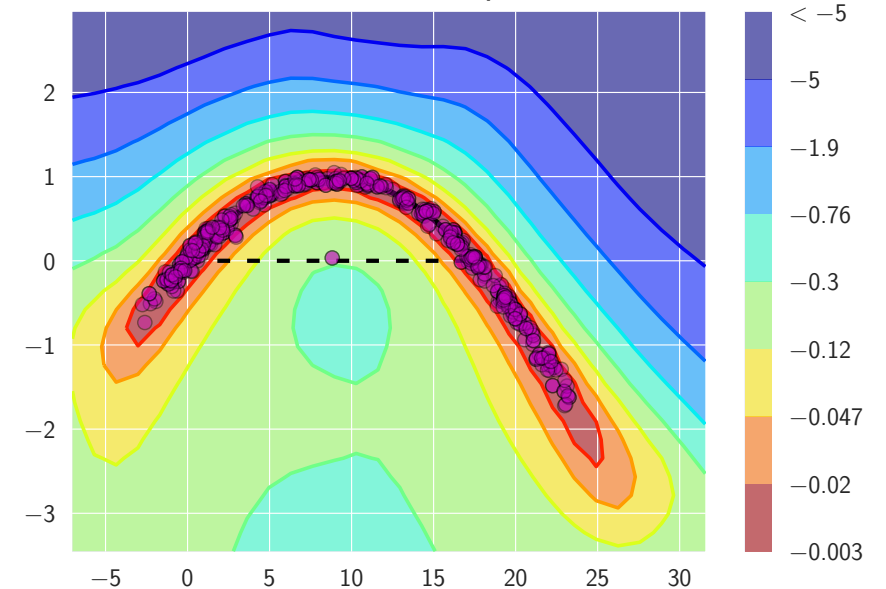

Posterior log-density  
ESS, Random Subspace

Posterior log-density  
ESS, PCA Subspace

Posterior log-density  
ESS, Curve Subspace

# SUBSPACE COMPARISON ON PRERESNET-164, CIFAR-100

Random Subspace  
Posterior log-density

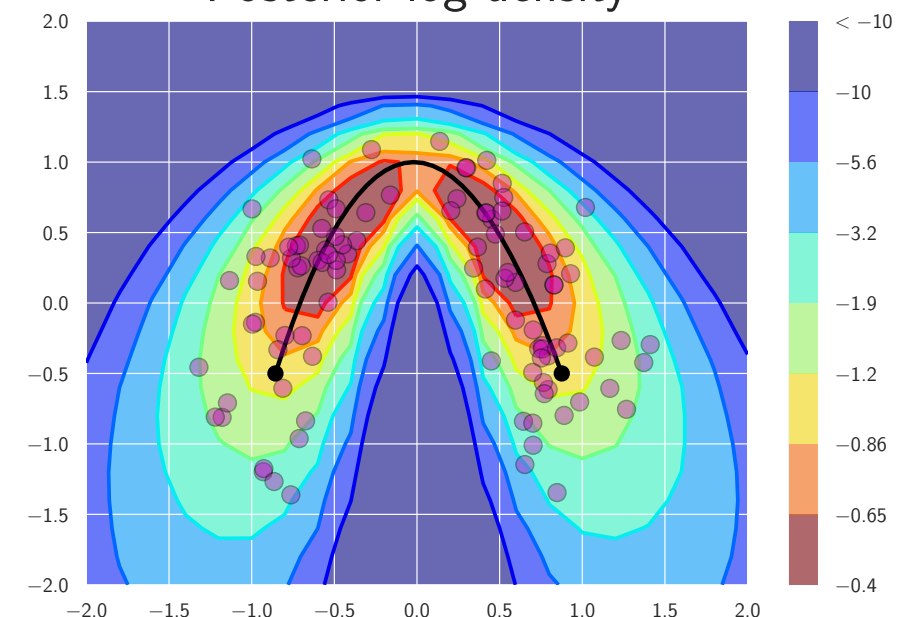

● ESS    - - - VI 3σ region

PCA Subspace  
Posterior log-density

● ESS    - - - SWAG 3σ region    - - - VI 3σ region

Curve Subspace  
Posterior log-density

● ESS

	SGD	Random	PCA	Curve
NLL	$0.946 \pm 0.001$	$0.686 \pm 0.005$	$0.665 \pm 0.004$	0.646
Accuracy (%)	$78.50 \pm 0.32$	$80.17 \pm 0.03$	$80.54 \pm 0.13$	81.28

## TAKEAWAYS

- ▶ We can apply standard approximate inference methods in subspaces of parameter space
- ▶ More diverse subspaces => better performance:  
Curve Subspace > **PCA Subspace** > Random Subspace
- ▶ Subspace Inference in the PCA subspace is competitive with SWAG (Maddox et al., 2019), MC-Dropout (Gal & Ghahramani, 2016) and Temperature Scaling (Guo et al., 2017) on image classification and UCI regression
